with subject: PlasmaLine education.

Eyelid lift without knife and leveling of lines and wrinkles - the hottest news in the beauty industry! PlasmaLine system is a non-surgical non-invasive treatment that shrinks excess skin that sits under and over the eyes and smooths out lines and wrinkles.

PlasmaLine pen has a tip that converts power into an electrostatic pulse. When the tip comes close to the skin, an oxygen-nitrogen mixture creates a flash of plasma light. For a tenth of a second, a microchannel opens into the skin and the heat from the plasma flash causes excess fluid to be vaporized out of the skin, resulting in immediate tightening. The superficial "injury" that occurs stimulates the skin's renewal of fibroblasts, which is an important part of skin's self-healing and collagen production.

Plasma Line is a type of connective tissue cell. The fibroblast is an oblong stationary cell of relatively long life. If necessary, divide it. Plasma Line produce the tropocollagen that forms outside the cell into collagen that builds up so-called extracellular matrix.

Benefits of PLASMA Line system

- Maximum effective rejuvenation
- Wide field of use
- Compatible with other rejuvenation methods
- Maximum recovery period - 7 days
- Effect increases within six months
- The procedure is easy to apply

Length of procedure 10-30 minutes

- No side effects
- Possible repeated use

With this treatment technology we can treat:

- Eyelids - inner, upper and lower
- Aged skin, fine lines and wrinkles
- Smoke around the lips
- Neck that has become wrinkled and relaxed
- Cleavage
- Skin tightening and rejuvenation
- Stretch marks

Plasma technology

Plasma is the fourth state of matter in which electrons are separated from atoms to form ionized gas. The flow of plasma stimulates the formation of new collagen and elastin fibers, improves sun damaged skin, reduces wrinkles and smooths the skin surface.

Plasma Lifting allows us to achieve great results without surgery, cuts, or narcosis in the following areas:

- Complete facelift
- Upper and lower eyelid tightening
- Wrinkle reduction (e.g., crow's feet, forehead, or lip wrinkles)
- Scar refining
- Removal of old age warts and skin tags
- Removal of age spots

Without scalpel and narcosis.

Without risk.

Low to no downtime.

Economical.

The Function of the Plasma Pen: The voltage difference between the plasma pen and the skin produces a small arc, which is able to shrink excess or unwanted skin. So we tighten, for example, Oberlider. The plasma pen is not invasive, which means it does not touch the skin but is guided over the skin at a distance of about 1mm. During treatment, swelling usually occurs for 1-3 days. The skin gets worse, this falls off a few days later. Then it stays for about 3-6 weeks a pink skin color. Depending on the complaint, 1-4 treatments are necessary. Plasma Lifting combined with our nano-microneedling and LED phototherapy is one of the most effective and high-quality anti-aging treatments and unique in your combination.

Aftercare following the treatment:

In the first 10 days at least twice a day, the treated areas cream with Tyrosur[®] gel and when you leave the house, additionally apply a sunscreen with SPF 50 (products available from us). Please maintain exclusively with our products. Please let the crusts (treatment points on their skin) heal off by themselves, do not scratch, rub or otherwise, but dab off very carefully with a cotton pad. Keep away from the sun for the prescribed period of about 14 days! Avoid sun exposure, UV light (including solarium), minus temperatures and sauna visits 2 weeks after treatment. If necessary (mainly on the eye area) may be cooled with a cold compress.

This makes a long lasting result, but as aging continues, treatment should be re-established after a few years or more depending on age and starting point
